**Creating proper directory structure for a Java web app**

The **HttpServlet** class
==================
1. Till now we have extended the **GenericServlet** class but since our application is going to run on the internet and every request which a browser send to a **Server** is an http request, so the Java team advices us to inherit a class called **HttpServlet** instead of **GenericServlet**.

2. This is because when we inherit **HttpServlet,** we get access to lot of additional information which the browser sends to the Server.

3. Moreover the class **HttpServlet** it self inherit **GenericServlet** so we get access to all previous 5 methods also
